HEADLINE FEATURES

Prepared from README.md, CHANGELOG.md & docs/ARCHITECTURE.md · published as react-native-permission-manager@0.2.0 on npm

Core Features & Benefits

Feature	What it does	Benefit
One-line API	<code>await PermissionsManager.request('camera')</code> — no native boilerplate.	Less code to write and maintain; fewer places for bugs to hide.
Auto rationale dialogs	Shows the Android "why we need this" prompt automatically before the system dialog.	Higher grant rates — users understand the ask before deciding.
PermissionGate component	Declarative wrapper that renders children only when a permission is granted.	No manual if/else UI branching for gated screens.
usePermission() hook	One hook exposes status, loading, error, request, ensure, and openSettings.	No hand-rolled state management per screen.
Auto refresh after Settings	Listens to AppState and re-checks status when the user returns from Settings.	UI is always accurate — no stale "denied" state after the user grants access.
Permission groups	Named bundles (media, location, communication, ...) or ad-hoc lists, checked/requested together.	One consistent call for multi-permission flows instead of repeated arrays.
Strong TypeScript support	Typed enums, literal permission names, discriminated result shapes.	Typos caught at compile time; full editor autocomplete.

Before vs. After

Without this library

- Separate Android + iOS permission code
- Manual rationale dialogs, if built at all
- Manual re-check after Settings redirect
- Ad-hoc arrays repeated across screens
- Loosely typed status strings

With this library

- One unified TypeScript API for both platforms
- Rationale + Settings dialogs shown automatically
- Status refreshes itself on app foreground
- Named, reusable permission groups
- Fully typed enums and result shapes

Built-in Permission Groups

Group name	Members	Typical use case
media	camera, microphone, photos	Video / photo capture flows
location	location, locationBackground	Maps, tracking, geofencing
contactsAndCalendar	contacts, calendar	"Connect your account" flows
communication	sms, callPhone, contacts	Messaging / dialer apps
connectivity	notification, bluetooth	Companion-device apps

Supported Permission Types

Architecture-Level Benefits

Principle	Where it shows up
Clean Architecture (domain → data → presentation)	New permission types or platforms slot in without touching existing use cases or the public API.
TurboModule / New Architecture ready	Works on Fabric/TurboModule apps and falls back to the legacy bridge for older RN versions.
SOLID design	One class per use case; interfaces (<code>IPermissionRepository</code>) make native calls swappable and mockable.
Unit tested	Jest suite covers use cases, repository/mapper logic, and the public facade with fake native data sources.
Native-side mirroring	Kotlin and Swift both split bridge glue from logic, so native behavior is independently testable too.

One-line summary

This library gives any React Native app a single, strongly-typed API for handling Android and iOS runtime permissions — including rationale dialogs, Settings redirects, auto-refresh, and grouped permissions — built on Clean Architecture so it stays easy to extend and safe to trust in production.
